

Introduce Yourself and why you chose this course

Hello Sir, My name is Siddharth Kaithwas and I'm from Allahabad, Uttar Pradesh. I did my B.Tech in Chemical Engineering from IET Lucknow in Chemical Engineering Stream. I did my internship from ONGC Ankleshwar on LPG Production Plant. I consider hard work, discipline, eagerness to learn new things, ability to solve complex problems and managing things as my strengths. My short term aim is to get placed at good and employee friendly organisation where I can gain experience and develop new skills and my long term aim is to be at a reputed position at an organisation where I can build my career and help the organisation at the same time. Apart from academics I'm have interest in cricket, dance, martial arts and astronomy as well and I had been actively involved in my interests too. I played cricket for my college team, had won bronze medal in state level group dance competition, hold blue belt in martial arts and I'm an active member and volunteer of State Astronomy Club.

I had interest in Computer and IT related field since my school days, I also opted for Computer Science with PCM in 11th Std and have been part of technical teams in college also. Since I could not get top college with CSE/IT branch so I went with Chemical Engineering. In college too, technical teams always excited me and I worked with many technical teams during college fests and workshops. It happened after my graduation in september 2020, that I realised I did not want to do job in chemical engineering domain as it does not excite me. So I started attending workshops and session related to software development and application development in search of career opportunities, that's when I came across data engineering term and when the instructor explained a little about it, I found it very interesting, I researched more about it and got to know about the opportunities in data related field. I researched more and more I used to spend hours researching and reading contents and I never felt exhausted and at that moment I felt that I can do this all day and not get tired. That's when I came across the position of data scientist and data analyst. As the name sounded to me, more exciting the work I found. I attended youtube lectures, went through syllabus, read various blogs (infact doing it till now) and realised there is still so much to be found in this field. So I decided to believe my instinct this time went through this course. I researched various schools and which course would be best suited for me and then I joined Edyoda.
